Disclosure & Conflict of Interest

Dr Pule is the founder and Chief Scientific Officer of Autolus Therapeutics plc and a clinical senior lecturer in the Dept. of Hematology at UCL Cancer Institute. The views and opinions expressed in this presentation are of Dr Pule in his personal capacity. The views expressed are his own and do not necessarily represent the views of Autolus Therapeutics.

Dr Pule receives or may in future receive royalties from intellectual property licensed by UCL to entities including but not limited to Autolus, Collectis, Blue Bird Bio and TC BioPharm

Dr Pule is on the scientific advisory board of Mana Therapeutics and Virocell Therapeutics.

Disclaimer

These slides and the accompanying oral presentation contain forward-looking statements within the meaning of the “safe harbor” provisions of The Private Securities Litigation Reform Act of 1995, including statements about the Company's plans to develop and commercialize its product candidates, the Company's ongoing and planned clinical trials, including the timing and initiation of such trials and statements regarding whether or not such trials will be considered pivotal trials, the anticipated benefits of the Company's financial condition and results of operations, including its expected cash runway; the development of Autolus' product candidates, including statements regarding the timing of initiation, completion and the outcome of pre-clinical studies or clinical trials and related preparatory work, and the periods during which the results of the studies and trials will become available; Autolus' plans to research, develop, manufacture and commercialize its product candidates; the potential for Autolus' product candidates to be alternatives in the therapeutic areas investigated; and Autolus' manufacturing capabilities and strategy. All statements other than statements of historical fact contained in this presentation, including statements regarding the Company's future results of operations and financial position, business strategy and plans and objectives of management for future operations, are forward-looking statements. In some cases, you can identify forward-looking statements by terms such as “may,” “should,” “expects,” “plans,” “anticipates,” “could,” “intends,” “target,” “projects,” “contemplates,” “believes,” “estimates,” “predicts,” “potential” or “continue” or the negative of these terms or other similar expressions. These statements involve known and unknown risks, uncertainties and other important factors that may cause the Company's actual results, performance or achievements to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. Factors that may cause actual results to differ materially from any future results expressed or implied by any forward looking statements include the risks described in the “Risk Factors” section of the Company's Annual Report on Form 20-F for the year ended December 31, 2019, as well as those set forth from time to time in the Company's other SEC filings, available at www.sec.gov. The forward-looking statements contained in this presentation reflect the Company's views as of the date of this presentation regarding future events, except as required by law, and the Company does not assume any obligation to update any forward-looking statements. You should, therefore, not rely on these forward-looking statements as representing the Company's views as of any date subsequent to the date of this presentation.

Certain data in this presentation was obtained from various external sources. Such data speak only as of the date referenced in this presentation and neither the Company nor its affiliates, advisors or representatives make any representation as to the accuracy or completeness of that data or undertake to update such data after the date of this presentation. Such data involve risks and uncertainties and are subject to change based on various factors.

Modular engineering approach to CAR T cell therapy in solid cancer

A Cancer Research UK Phase I trial of anti-GD2 CAR T-cells in patients with relapsed or refractory neuroblastoma (1RG-CART)

Karin Straathof, Barry Flutter, Rebecca Wallace, Simon Thomas, Gordon Cheung, Angela Collura, Talia Gileadi, Jack Barton, Gary Wright, Sarah Inglott, Lorenzo Biassoni, Kieran McHugh, David Edwards, Claire Barton, Karen Dyer, Nigel Westwood, Thalia Loka, Sarita Depani, Karen Howe, Giuseppe Barone, Martin Pule and John Anderson

Straathof et al, Sci Trans Med, 2020

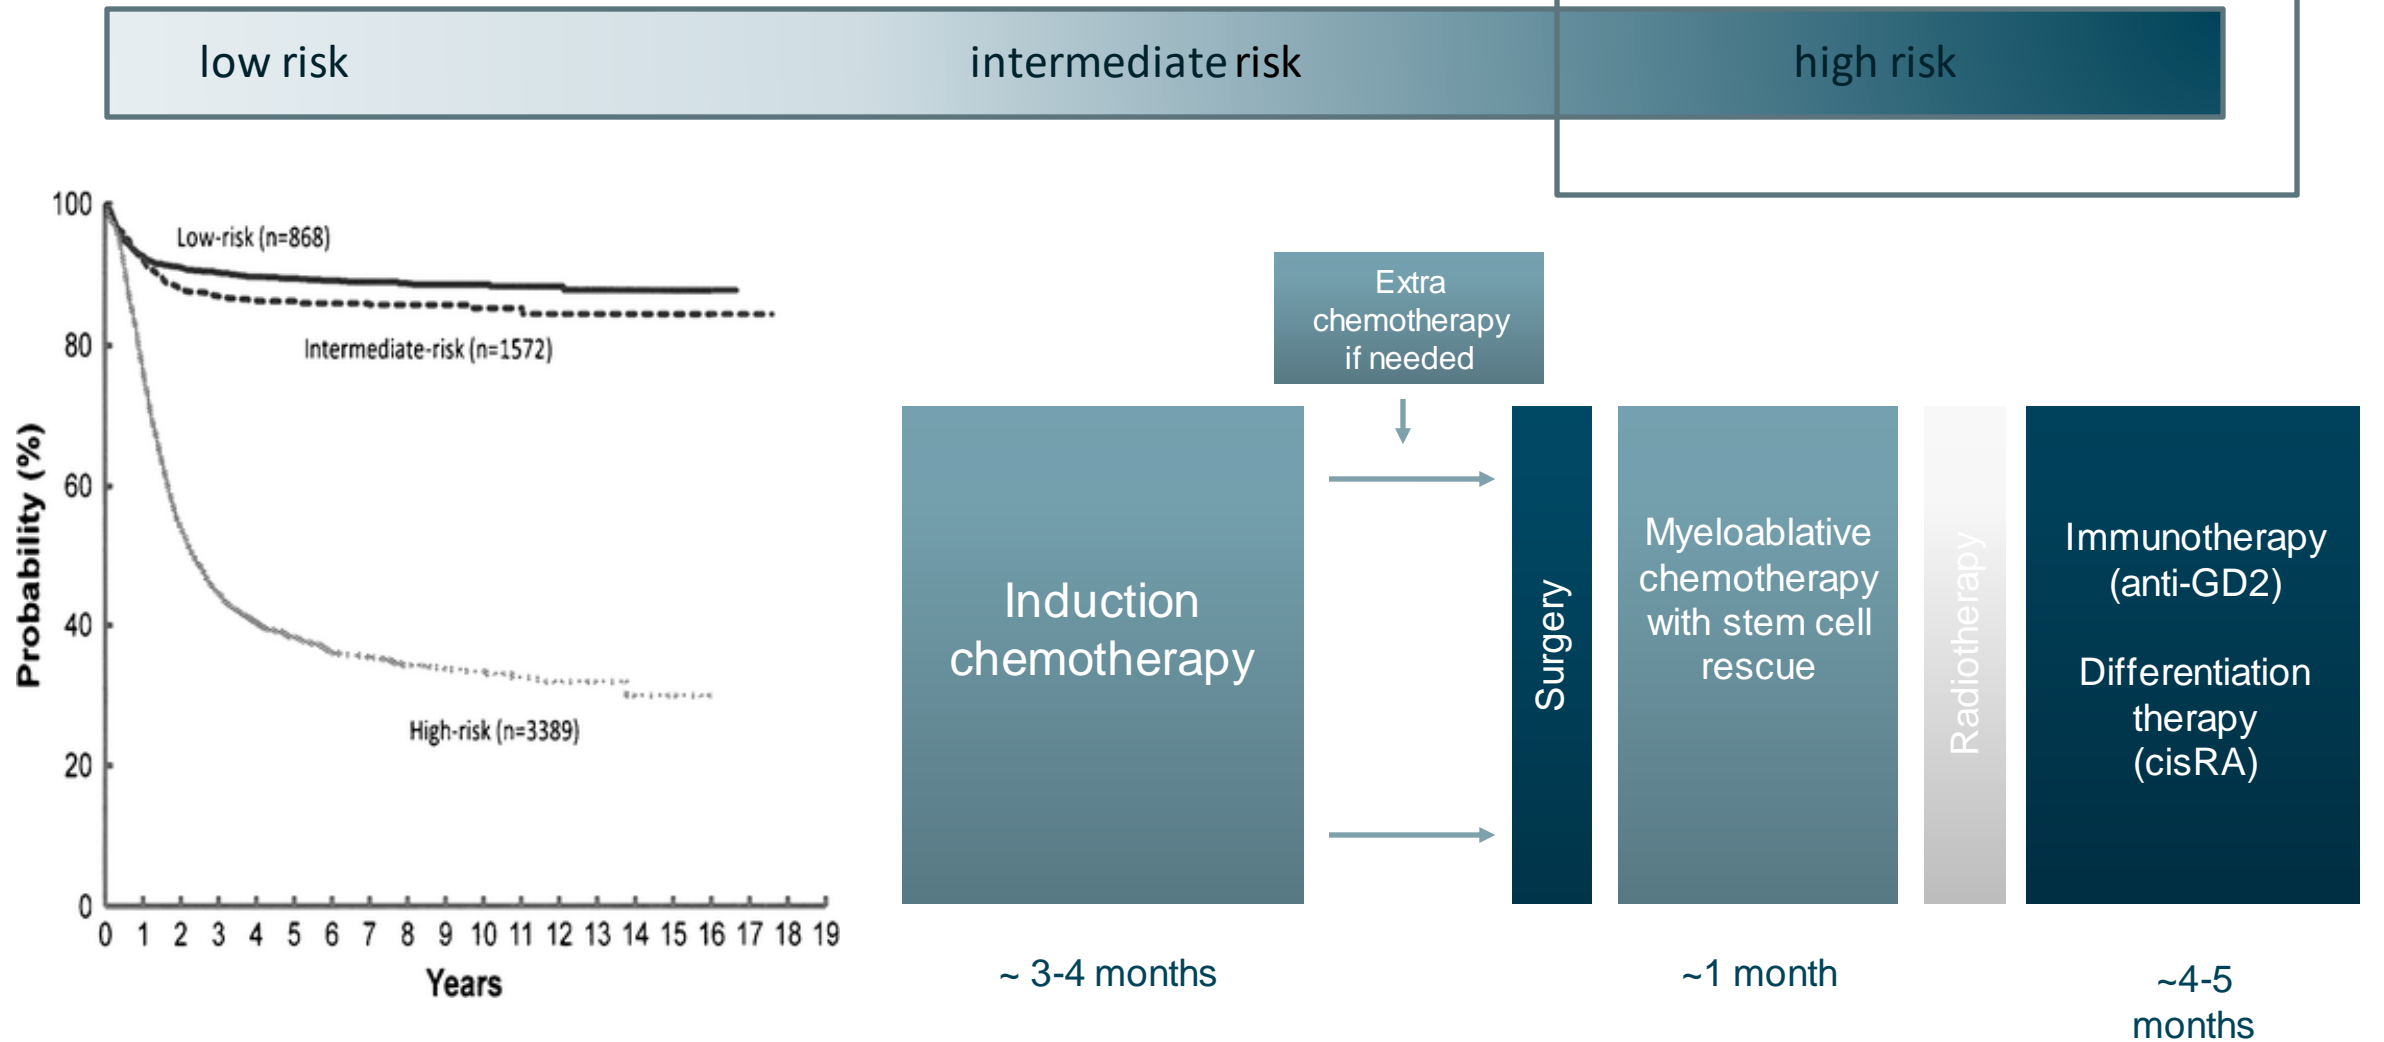

Most common solid tumour after brain tumours

Median age at diagnosis: 17 months

New diagnoses/year: 100 in UK, 800 in USA

Need for new treatment modality

Target antigen: disialoganglioside GD2

- Abundantly expressed on neuroblastomas
- Dim expression on normal tissue restricted to neurons
- Experience targeting GD2 with therapeutic monoclonal antibodies
- CART approach to induce durable anti-GD2 immunity

GD2-CAR with humanized novel binder

Transfer Vector

- SAR enhanced MoMLV
- Bi-cistronic with 2A peptide

RAEGRGSLTTCGDVEENPG↓P

marker/suicide gene
RQR8 allows tracking
by flow cytometry

Binding Domain:

- Humanized scFv
- Not 14:18 GD2 mAb derived

Spacer:

- Human IgG1 Fc
- Mutated to avoid FcR binding

Endodomain

- 2nd Generation CD28-ζ

Phase I dose escalation design

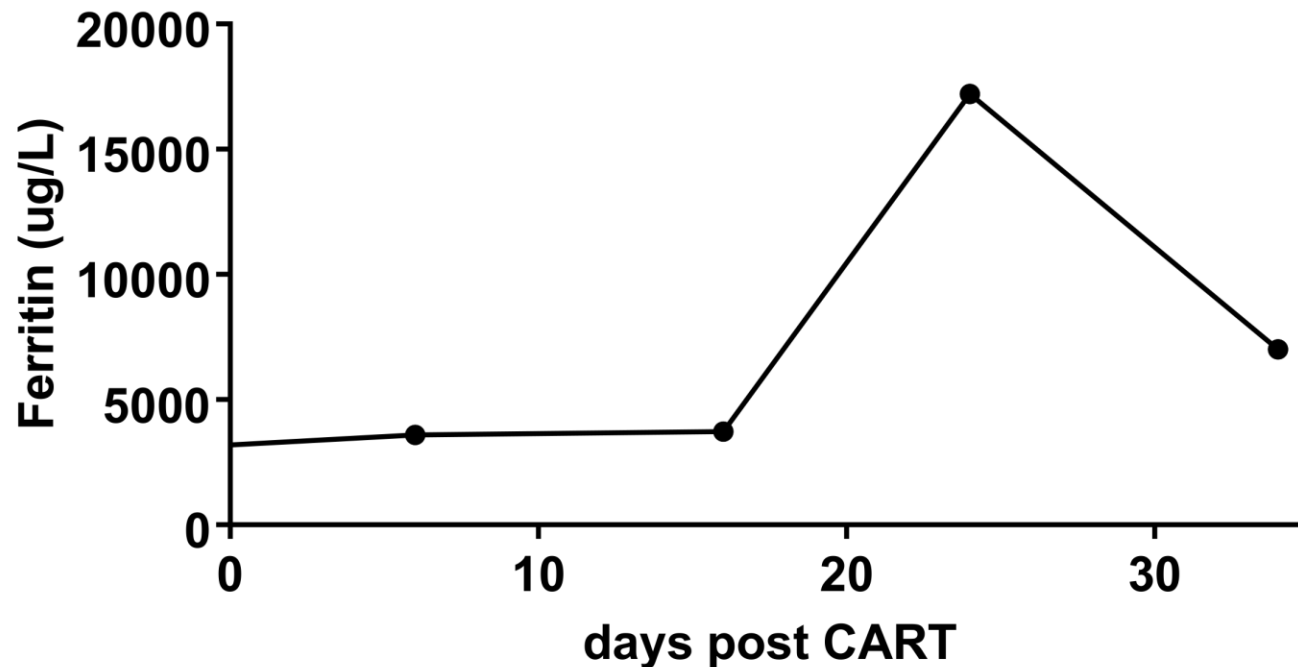

Rolling 6 design

				$1 \times 10^8 / \text{m}^2$	$1 \times 10^9 / \text{m}^2$
CART dose	$1 \times 10^7 / \text{m}^2$	$1 \times 10^7 / \text{m}^2$	$1 \times 10^7 / \text{m}^2$		
lymphodepletion	none	Cyclophosphamide 1200 mg/m ²	cyclophosphamide 1200 mg/m ² fludarabine 125 mg/m ²		
	Cohort 1	Cohort 2	Cohort 3	Cohort 4	Cohort 5

Week 1: cytokine release syndrome

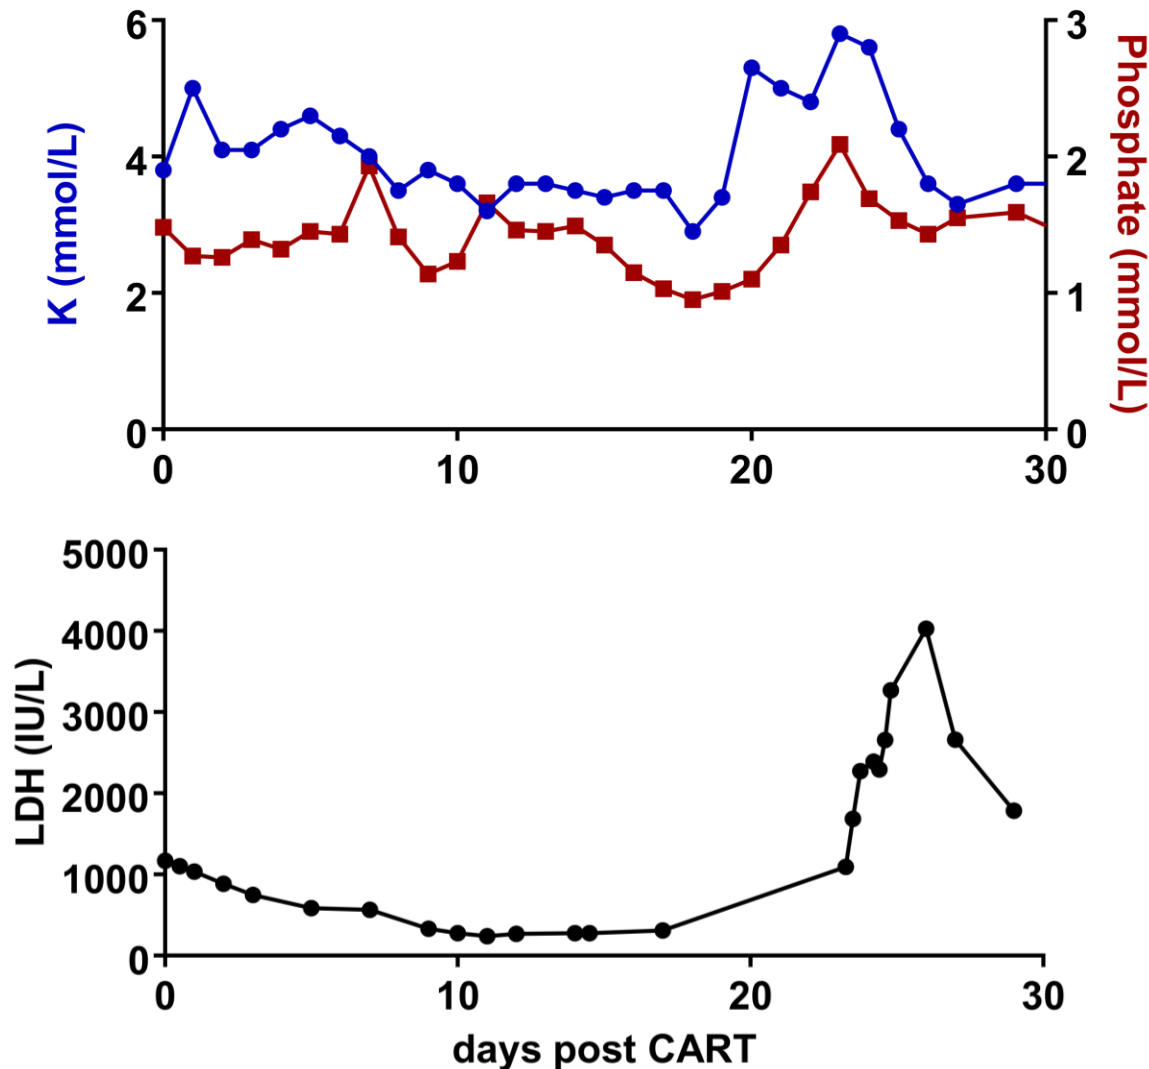

Week 2: macrophage activation syndrome

- From day +7 hepatomegaly, ascites, weight gain
- Raised ferritin, and sIL-2R triglycerides
- Supportive management
- Clinical symptoms resolved by day +22

Week 3: secondary tumour lysis

- Back pain and recurrence fever from day +21
- Rise in LDH, K and PO₄
- Supportive management
- Clinical symptoms resolved by day +24

Patient 10: decrease BM tumour burden

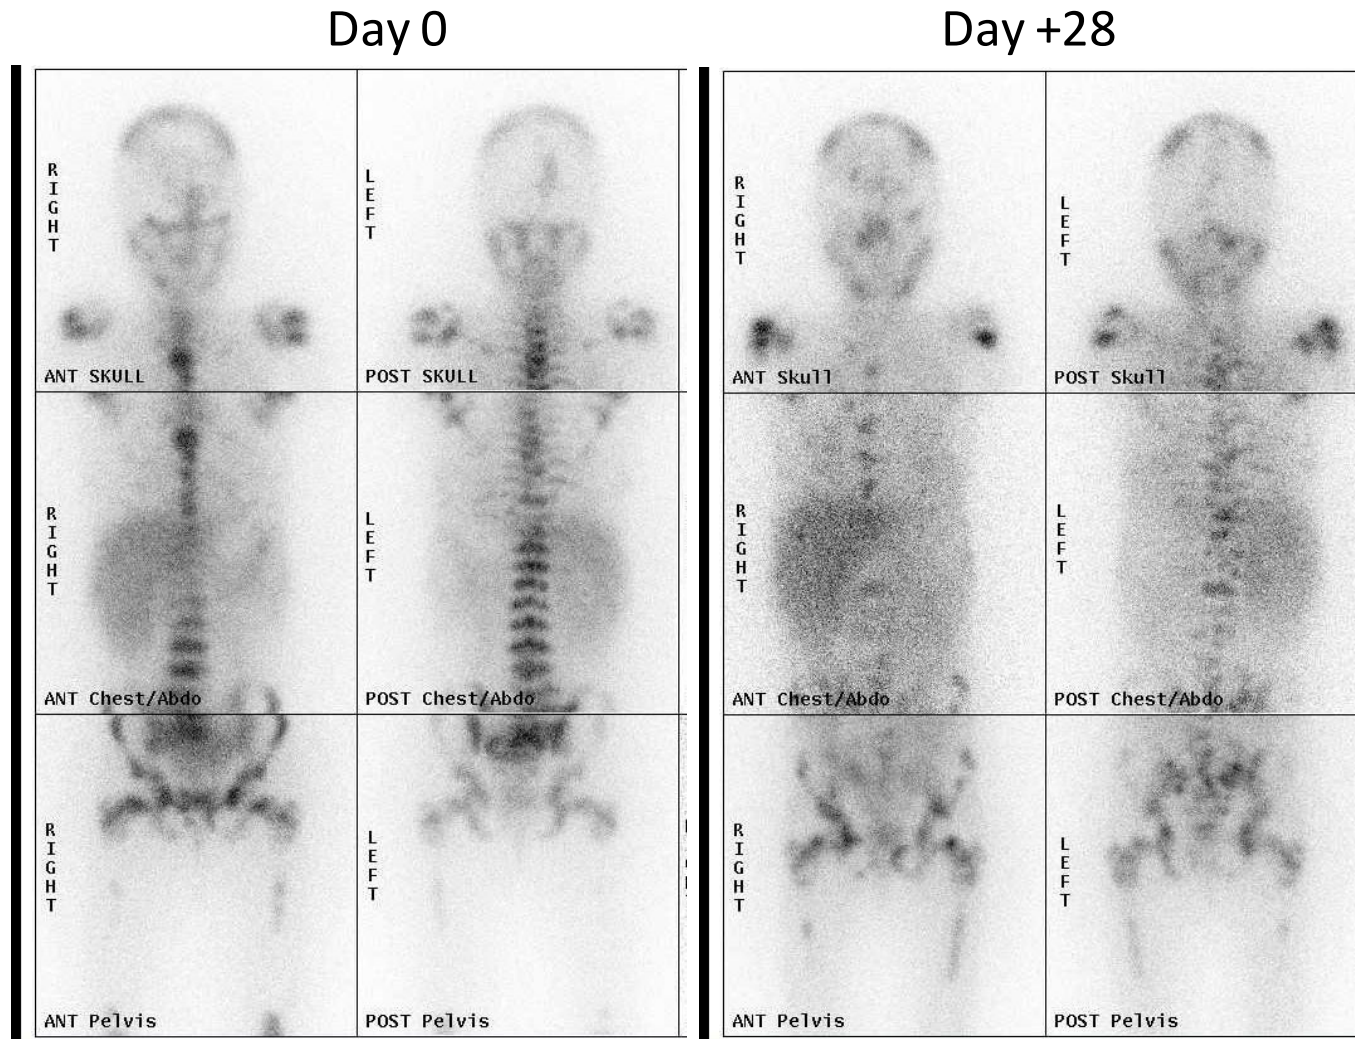

Day 0

Day +28

Pt 10: reduced MIBG uptake/SPECT activity

MIBG: iodine-123-meta-iodobenzylguanidine

SPECT:

Single photon emission computed tomography

Straathof et al, Sci Trans Med, 2020

Patient 10: prolonged pancytopenia

cyclophosphamide/
fludarabine

CART

- Patient with pre-existing limited bone marrow reserve and bone marrow involvement neuroblastoma
- Profound lymphopenia following conditioning
- Apparent neutrophil recovery at day +20
- Recurrence of pancytopenia
- Highly blood product dependent

- Repeat bone marrow aspirate at day +45 showed hypoplasia and early disease regrowth
 - 1RG-CART detected in blood on day +42 by PCR, undetectable by flow
- Patient died of pseudomonas septicaemia on day +50
- Two further patients had signs of CAR T cell activity

CONCLUSION: GD2 CAR can work without on-target toxicity but effect is transient.

- Further clinical data from Stanford and Rome support use of D2 as a solid tumour bCAR T target

The problems (compared with lymphoid malignancies)...

1. Antigen sequestered at tumour sites

2. Microenvironment

The solution...

Modular GD2 CAR-T design (MCARGD2): to achieve durable activity

Improve persistence and function in the hostile tumour microenvironment (TME)

GD2 CAR

Shows anti-tumor activity in patients in the absence of neurotoxicity

Safety Switch

To deplete CAR-T cells in the event of unacceptable toxicities

dSHP2

Truncated SHP2 to block multiple checkpoint signals

dTGFβ Receptor

Truncated TGFβ receptor to render CAR-T cells resistant to TGFβ inhibition

Cytokine signal

Constitutively active cytokine signal to improve persistence

Co-transduction results in high percentage of double positive CAR-T

Vector 1

Designed to improve CAR T cell persistence

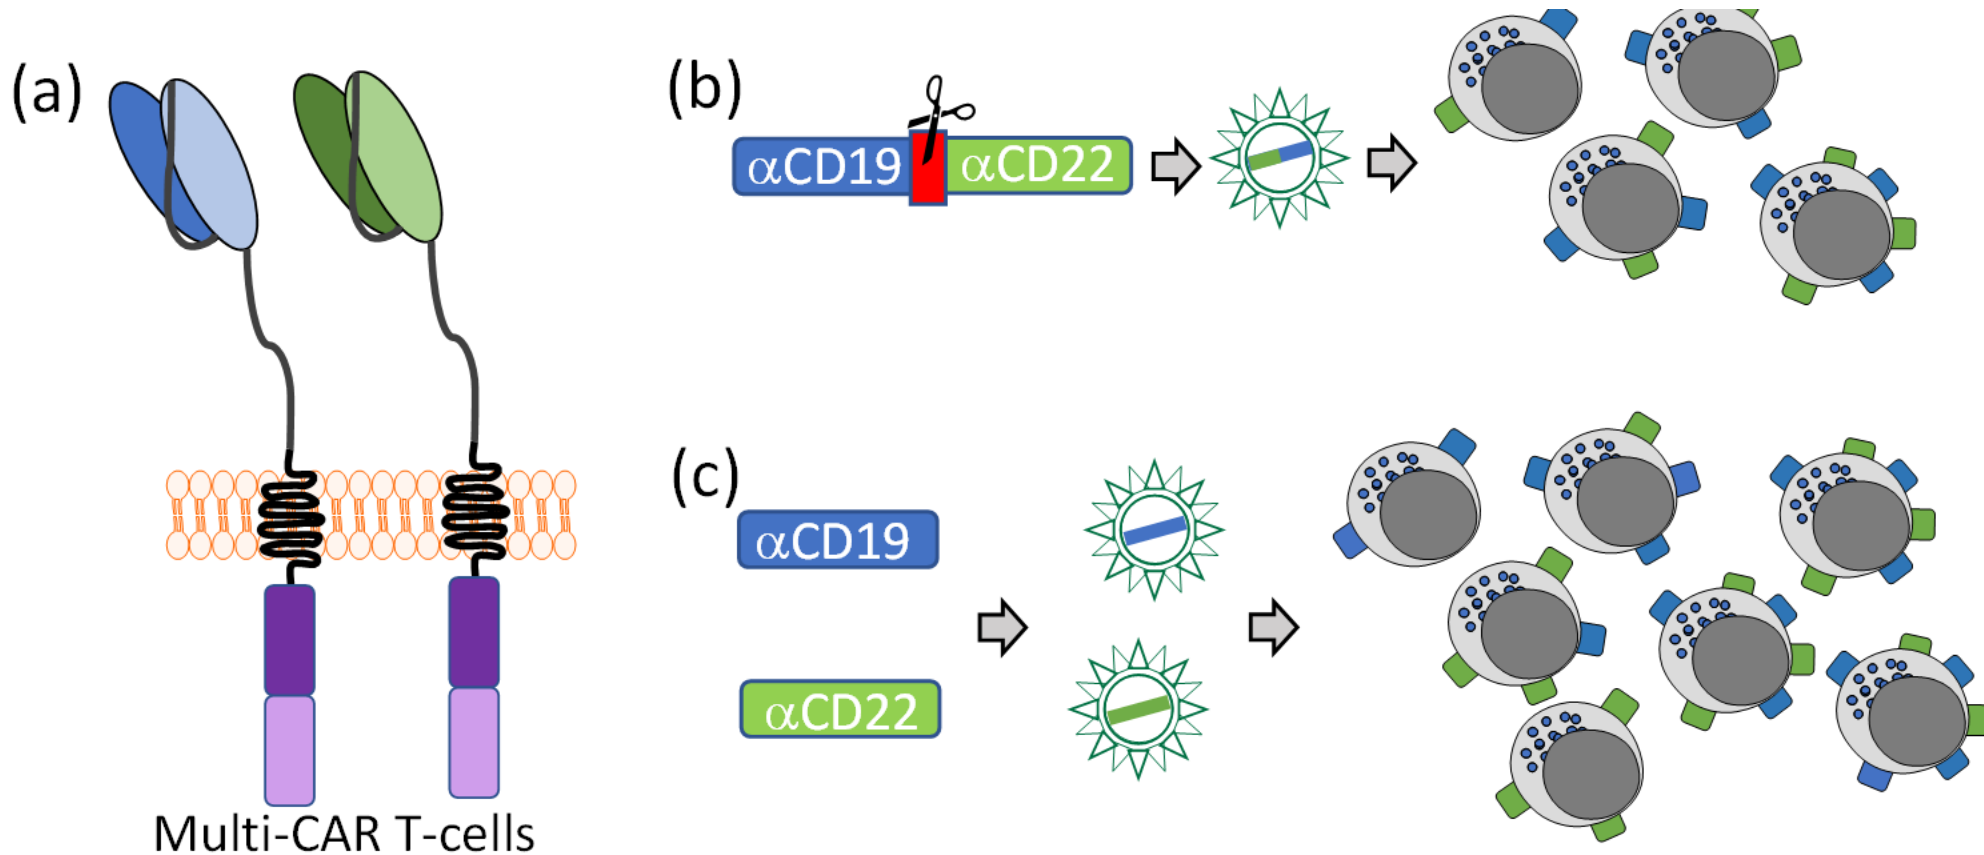

Vector 2

Designed to support CAR T cells function in TME

UCL current CD19/CD22 strategy: co-transduction

- Co-expression of transgenes can be achieved using FMD 2A like peptides
- Alternatively, T cells can be co-transduced with multiple vectors
- Co-transduction lacks a fixed stoichiometry which may allow extra insight into in vivo behavior

Co-transduced CAR T products are in the clinic

CARPALL V3

NCT02443831

(Ghorashian et al, ASH, 2021)

MinoDabCar

ITIM - SHP1/2 is an inhibitory signaling bottle-neck

- Ligation of inhibitory receptors on the surface of tumor cells impair a T cell's ability to kill the tumor
- Many immune checkpoints act through a common T cell signaling pathway:
 - PD1 (PDL1 ligand)
 - 2B4(CD48 ligand)
 - BTLA (HVEM ligand) etc
- Ligation of these inhibitory receptors leads to the recruitment and activation of SHP1/2 phosphatases
- Active SHP1/2 dephosphorylates the CD3z domain of the CAR or TCR and inactivates the T cell

Truncated SHP2 can inhibit SHP1/2 signaling

- Other approaches may only tackle one inhibitory receptor at a time using antibodies or gene editing
- We have designed a truncated SHP2 module that lacks the phosphatase domain and is unable to inactivate the T cell

Truncated SHP2 can inhibit SHP1/2 signaling

IFN γ production

72h SupT1 GD2 PDL1

Blocking TGF β Signaling Using a Truncated TGF β Receptor (dnTBR2)

- TGF- β is a key negative regulator of the immune microenvironment
- dnTBR2 lacks signaling endodomains and when over-expressed acts in a dominant negative manner

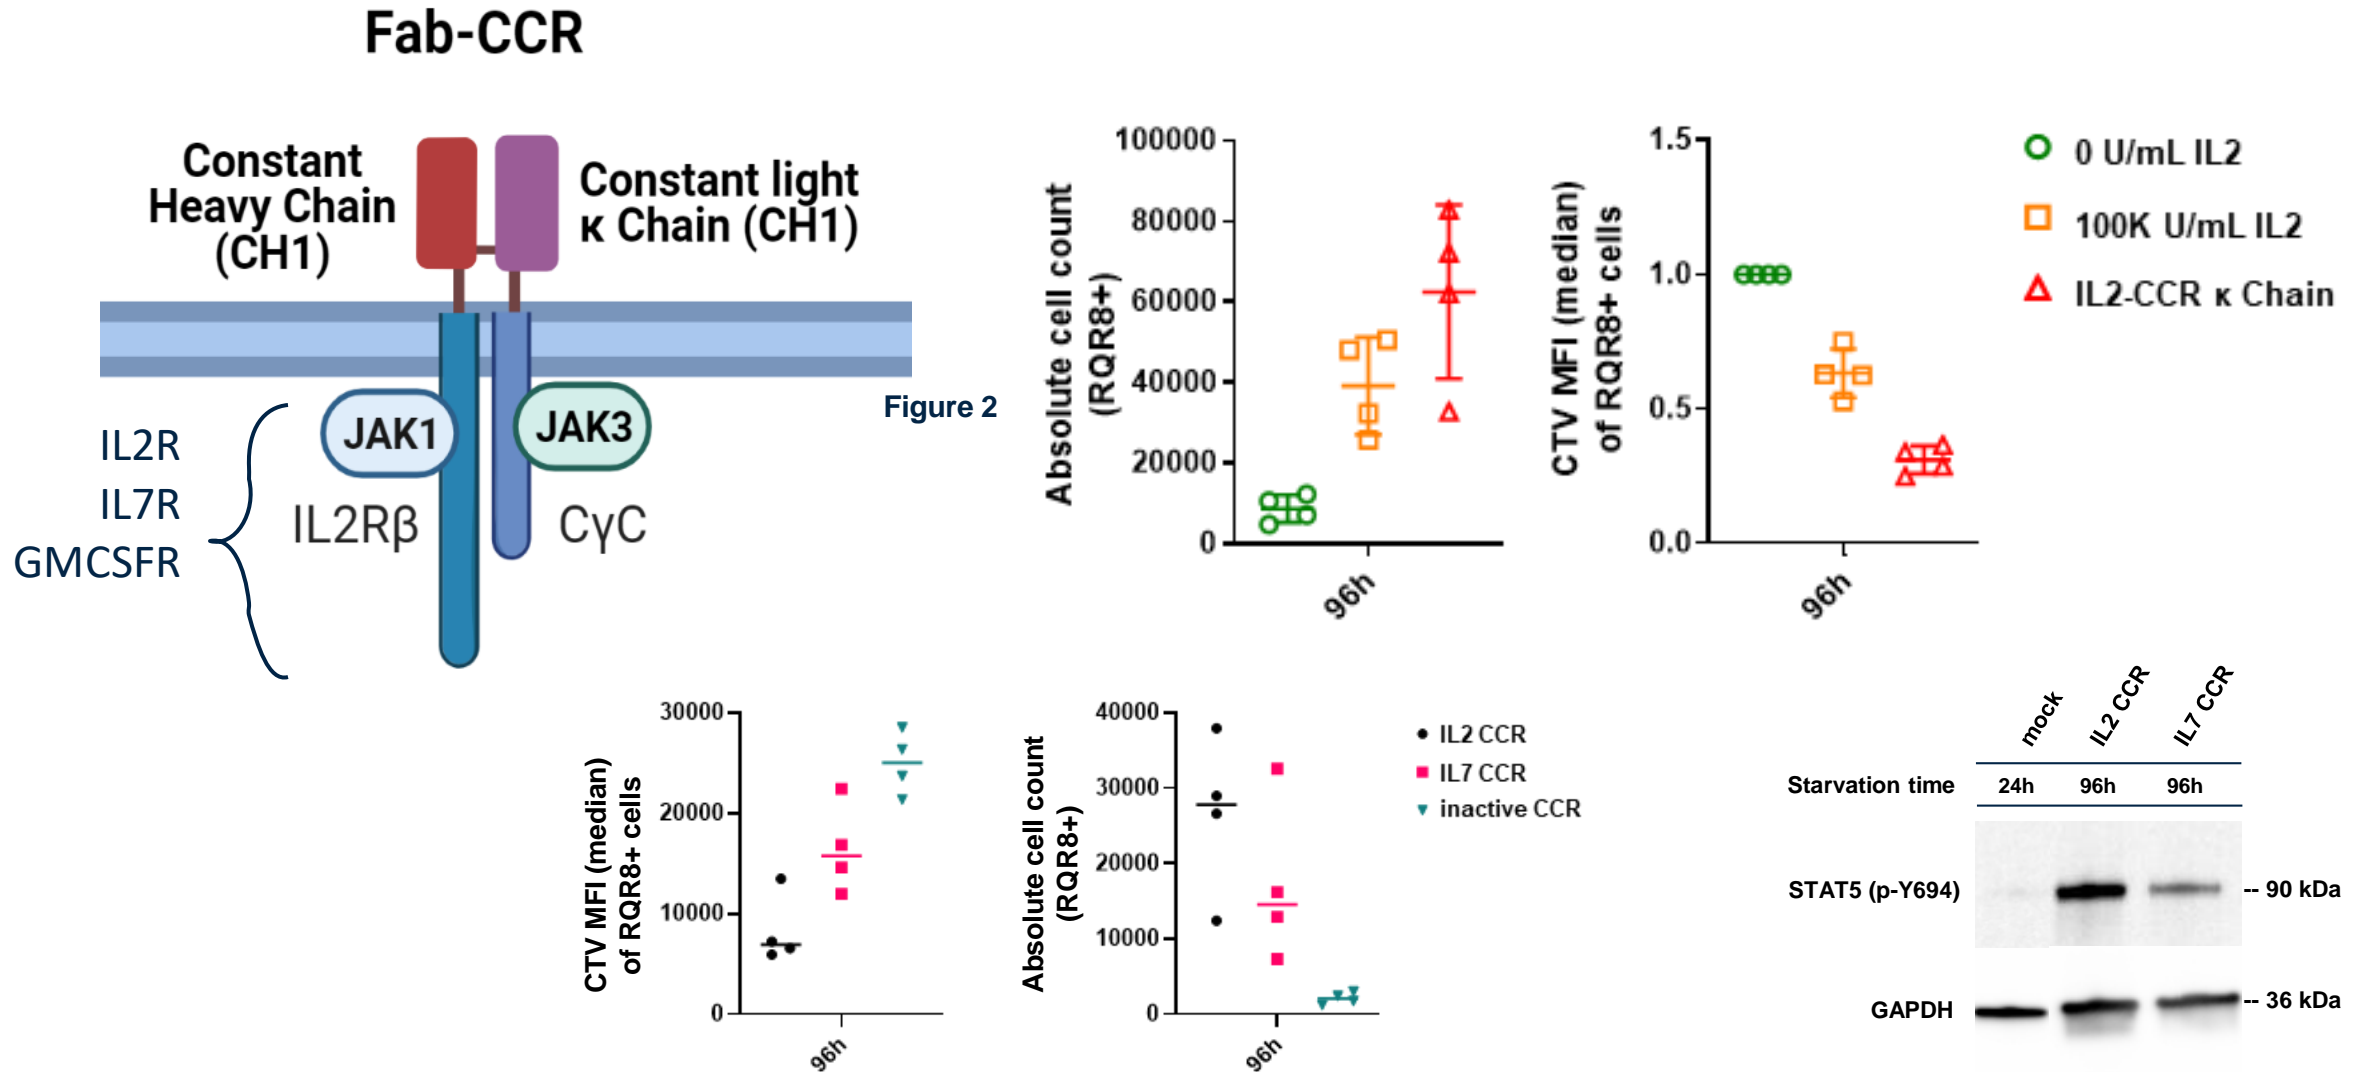

Bollard, C. M. *et al. J. Clin. Oncol.* **36**, 1128–1139 (2018).

Blocking TGF β Signaling Using a Truncated TGF β Receptor (dnTBR2)

IFN γ production

Heterodimeric constitutive cytokine receptor

IL7 CCR promotes low-level cell turnover

CAR-T proliferation in absence of exogenous cytokine

CAR-T proliferation remains depended on CAR ligand

IL7 CCR promotes low-level cell turnover

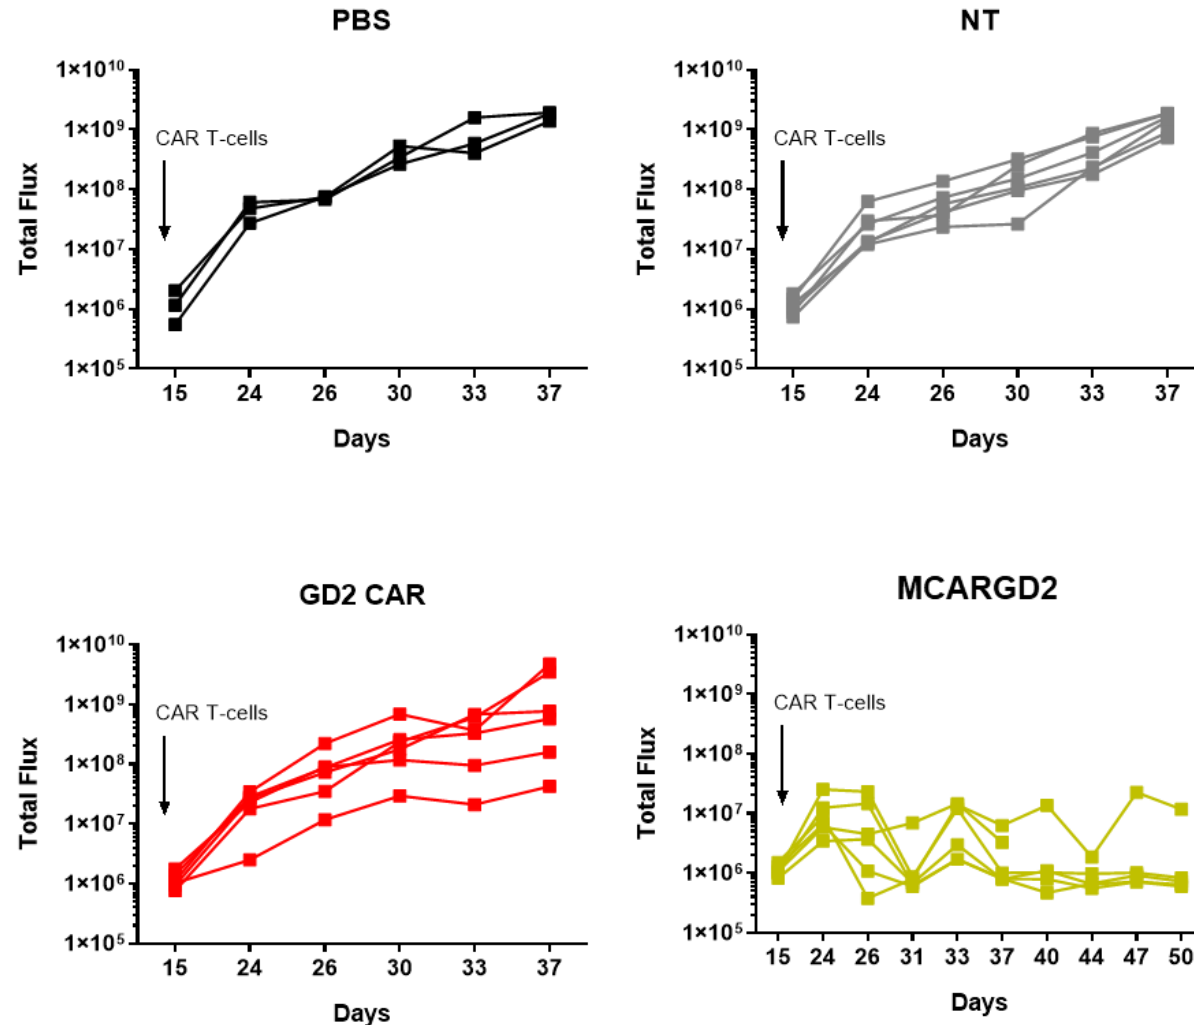

E:I =1:1
n = 4

Co-culture of CAR T cells + SupT1 GD2 re-challenged with 50,000 targets every 3 or 4 days

In vivo activity of MCARGD2 in pre-clinical neuroblastoma model

In vivo activity in established CHLA-255 xenografts in NSG mice

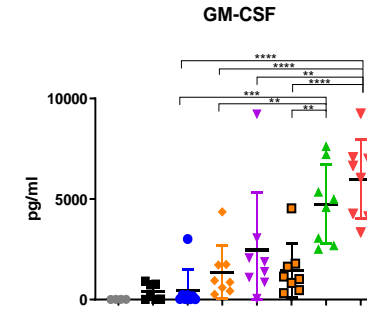

In vivo activity of MCARGD2 in pre-clinical SCLC model

H446 s.c. model

Tumor growth

Serum cytokines

Multi modular GD2-CAR (MCARGD2) clinical trial design

Phase I:

- r/r neuroblastoma
- co-transduction autologous apheresate with vector A and B
- establish optimal CAR vector (combination) and cell dose

Possible Expansion cohorts:

- Include other GD2+ childhood solid tumours (DIPG and Osteosarcoma)
